Guide Questions:

1. Why is external CSS better for large websites?
 - External CSS is better for large websites because it is written in a different file, meaning it is much more organized compared to inline and internal. One CSS file can style many webpages, so code repetition is no need. Updating the file will automatically update the whole design of the website. Lastly, it is much cleaner in the HTML file, it stays simple and focused on its structure rather than the design.
2. How does CSS improve the appearance of forms?
 - CSS can make form appearances much more modern, user friendly, and organized. Compared to a form without CSS, it can look plain and hard to use.
3. What happens if the CSS file is not linked properly?
 - If the CSS file is not properly linked in the HTML file, it won't display the intended design. Once the webpage or website is running, the layout may appear unorganized, broken, or unfinished. The common causes that may lead to this are wrong file path, misspelled file name, and missing link tag in the HTML (<link>)
4. Which part of the page was hardest to style and why?
 - For me, the hardest part was formatting and organizing the form. It was not indicated in step 3 to organize it, but I wanted to for the user interface to look better.
